PORTFOLIO

Design Philosophy

As a passionate architecture student, I believe design has its own power to shape experiences, foster well-being, and inspire communities. My work emphasizes a balance between aesthetics and functionality, exploring how natural elements and cultural context can inform innovative solutions. I am committed to creating spaces that promote sustainability, inclusivity, and emotional connection, while continuously evolving through collaboration and by learning.

“BRIDGE1400”

Connecting Waterfront Culture to Urban Density

Bridge1400 is conceived at the charged threshold between Seattle’s mercantile downtown and its experiential waterfront, an urban condition shaped as much by economy as by memory. Rather than mediating the disjunction, the project exposes and spatializes it. A monumental vertical void cuts through the podium, forming a civic canyon that links Alaskan Way to Western Avenue, commerce to leisure, street to sky. Within it, a grand stair performs as both passage and pause, while a spiraling ramp choreographs a slow ascent framed by biophilic gardens and filtered views of Elliott Bay.

This architectural bridge is not a structure in the literal sense, but a conceptual device. The project resists the flattening of typology and instead constructs a narrative of passage, threshold, and transformation. Its material expression is restrained but deliberate, allowing light, vegetation, and movement to become the primary elements of form-making. Bridge 1400 thus argues that in a city shaped by tides both cultural and literal architecture can act not as backdrop, but as active participant in urban storytelling.

Mixed-use Hotel | View from Alaskan Way

BRIDGING THROUGH MASS TIMBER

Connecting Waterfront Culture vs. Urban Density

Seattle's waterfront pulses with movement of ferries, piers, seafood markets, and public promenades define a lifestyle steeped in openness and flow. This culture values visibility, access, and material honesty, reflected in the building's use of glass and timber that echo marine and industrial traditions.

Waterfront Culture

WESTERN EDGE | TOURISM

Hotel Spaces

The upper tower serves as a retreat above the city, offering panoramic views of Elliott Bay. Its mass timber structure fosters warmth and quietude, blending hospitality with biophilic design principles that celebrate light, tactility, and connection to nature.

Spatial + Experiential Continuity

Downtown Seattle's verticality, rhythm, and high program intensity inform the project's massing logic. The eastern edge of the site draws from this dense fabric, stacking functions vertically and responding with a refined urban scale while integrating back-of-house services and circulation discreetly.

Urban Density

EASTERN ZONE | COMMERCIAL

Retail Spaces

At street level, the retail podium activates the pedestrian zone with transparent frontage, diverse tenant spaces, and multi-entry points. It forms the tactile interface between public life and the building, inviting both locals and visitors into a layered commercial experience.

STEP 1 Initial Massing
A full-site envelope was established, occupying the entire parcel footprint with a uniform 12-story height, maximizing allowable zoning potential.

STEP 2 Daylight Optimization
A major cutout along Alaskan Way reduces bulk and introduces an elongated tower mass parallel to Western Avenue. This move enhances daylight exposure to adjacent spaces and breaks the monotony of the full-height volume.

STEP 3 Voiding for Interlocking
A deeper cut at the lower southeast corner, facing Union Street, sets the stage for introducing a secondary, interlocking tower mass with a sloped profile.

STEP 4 Secondary Tower Mass Insertion
A smaller, slanted volume is introduced, interlocking into the main tower. This creates formal tension and visual interest while expressing dual massing language.

STEP 5 Podium Articulation
A 4-level podium base is added, housing retail programs and hotel lobby functions. A grand vertical void is introduced at the corner to visually and physically invite pedestrians inward.

STEP 6 Access Carveouts
Additional cutouts at the southeast corner (for egress stairs) and southwest edge (for direct retail and restaurant access) further articulate the podium's public interface.

STEP 7 Central Atrium
A mid-block cutout introduces a light-filled atrium at the podium's core. Another cut on the east face creates a welcoming retail entry fronting Alaskan Way.

STEP 8 Experiential Ramp Addition
A gently sloped internal ramp is introduced to connect Level 5 to Level 4. This feature offers an experiential promenade with panoramic waterfront views, enhancing guest experience and spatial continuity.

LEVEL 6-9
Floor Plan

The hotel rooms are organized to maximize access to views, daylight, and acoustic comfort while maintaining operational efficiency. Their orientation responds directly to the site, framing the waterfront to the northwest and the urban intersection at Western Avenue and Union Street to the southeast.

The fitness center is positioned to offer natural light and open views, providing an energizing environment for guests while maximizing visibility and program value.

The restaurant connects vertically to its upper level through a stair traversing a central void, creating spatial drama and encouraging visual and physical continuity between the two dining zones.

An outdoor restaurant extends from the main dining area, creating spatial variety and drawing foot traffic from Union Street and Western Avenue.

The retail shop features **double-height**, dual-glazed windows that enhance street visibility while reducing solar heat gain, improving thermal comfort and energy efficiency.

An 12-foot-deep elevator pit is integrated below the elevator shaft to house mechanical systems, ensure safe bottom clearance, and comply with code requirements for hydraulic or traction elevator installations.

The drinks bar functions as a social anchor within the project. Positioned to capture views of the waterfront and city, it extends hotel activity beyond guestrooms and encourages interaction between visitors and locals.

A wide, gently sloped ramp links the level 4 swimming pool with the semi-outdoor and outdoor seating areas of the level 5 bar. This spatial connection offers guests a continuous experiential journey, enhancing accessibility while framing dynamic views of the waterfront.

The restaurant connects vertically to its upper level through a stair traversing a central void, creating spatial drama and encouraging visual and physical continuity between the two dining zones.

A dedicated kitchen supports the café, ensuring efficient service and maintaining food quality. Strategically placed near the café, it allows seamless back-of-house operations while keeping

The retail shops activate the street edge and strengthen the public interface of the building. Large, double-height glazed storefronts enhance visibility, draw pedestrian flow from Alaskan Way and Western Avenue, and create an open, inviting atmosphere.

“FORESTREAT”

Promoting relaxation and well-being through nature

A Japanese practice called “*Shinrin-yoku*” oftentimes referred to as forest-bathing that involves spending time in a forest to promote relaxation and well-being. The practice involves being calm and quiet in the forest, observing nature, and breathing deeply. In a healthcare environment, trees can have the ability to soothe, calm, and restore one’s mood and overall well-being. They promote gathering and community and, in turn, remove barriers and stigma of the healthcare environment.

REM and Ridgefield share their first integrated clinic together. We break these grounds with the eternal forces of root and stem. We react to changing conditions in Ridgefield that sees dramatic reduction in green space and tight control of remaining green spaces.

Forestreat is an origin which gestures to the infinite. Circularity of form denotes regeneration, and radial arrangements of services create focal points for community engagement.

Concept Analysis

Trees

- A symbol for wholeness, transformation, stability, strength, and life itself.
- Provides support by providing food, protection, and habitat to wildlife.
- For the community and environment, it provides oxygen, better air quality, and water conservation.

Trees in Healthcare

- Ability to soothe, calm, and restore one's mood and overall well-being.
- Promote gathering and community.
- Remove barriers and stigma of the healthcare environment.

Leaves

Represent what is being renewed, revived, and grown. Changing with the seasons, the leaves can be a symbol for the differing needs of user groups in healthcare.

Trunk

The trunk symbolizes strength and stability. Located between the branches and roots, it unites all elements that maintains a balance between separation and connection.

Branches

As the extensions of the tree, it emphasize the uniqueness within each organism. Each branch can serve as support for wildlife.

Roots

Hidden from view, often forgotten, the roots are the foundation of trees. They serve as a well-balanced and efficient structure for it's successful growth in the future.

S

Strength

- Neighboring views to vegetation
- Close to I-5
- Adjacent Bus Stop
- Good daylight access

W

Weakness

- Exposure to noise
- Overcrowded road network
- Noise from construction activity

O

Opportunity

- Growth potential of Ridgefield
- Adjacency to commercial space
- Nearby dental office

T

Threat

- Adjacent industrial infrastructure
- Nearby gas station
- Lack of space
- Isolation from schools and nursing homes

Combining platonic form geometries

Encorporating more dynamism in form composition

Adding axis to the arrangement with more dynamism

Allowing more connectivity for visibility and ventillation

Incorporating certral gathering space for both type patients

Exploring different orientation for more ventillation and light

Exploring different articulation of forms

Finalizing the sketch for plan development

“SOLARIS”

Fueled by Daylighting: The Fatigue-Free Workplace

We, April Associates is dedicated in creating a space that utilizes daylight to improve the working and retail experience in the South Lake Union region, reducing the work-related stresses often found in office spaces. **79%** U.S. employees had experienced work-related stress from a 2021 survey by the American Psychological Association (APA).

In the US, every 3 of 5 employees reported negative impacts of work related stress, including lack of interest, motivation, or energy (26%) and lack of effort at work (19%). Meanwhile, 36% reported cognitive weariness, 32% reported emotional exhaustion, and an astounding 44% reported physical fatigue, a 38% increase since 2019.

Our real estate partner, Vulcan Real Estate (VRE), values integrity by earning the respect of their clients and acting with mindfulness while conducting their ethical and legislative duties as a company. They strive for excellence in all activities, including innovation and leadership in the Real Estate industry.

Mixed-use Office | View from 9th Ave N and Roy St. Node

History of South Lake Union, Seattle

Incorporating 3 of the 7 Living Building Challenge Petals:
1. Place: Rooting the design in the local Seattle context (701 9th Ave N) and restoring the site from a parking lot to a vibrant mixed-use hub.
2. Health + Happiness: creating a "Fatigue-Free" workplace by maximizing daylight exposure and prioritizing occupant well-being.
3. Beauty: Designing an inspiring, cinematic aesthetic that uplifts the human spirit and connects people to the environment.

- Conceptual Analysis**
- Familiar Materials: Using common brick creates a sense of grounded warmth and approachability by connecting the new structure to the familiar, historic fabric of the neighborhood.
 - Daylight: Maximizing daylight exposure transforms the workspace into a fatigue-free environment that aligns with natural circadian rhythms to boost mental vitality.
 - Green Spaces: Integrating green spaces offers a refreshing biophilic connection that acts as a natural reset button, lowering stress and recharging occupants throughout the day.

STEP 1 Street Interaction
Top mass stretches to the full extent of the site while bottom one shrinks inside to interact with the streets.

STEP 2 Stacking Together
Masses stacks together into a singular form within the allowable height.

STEP 3 A Light Tunnel
East facade gets cut into a void to let the morning light in.

STEP 4 Daylight Exposure
North facade gets cut into a void to let the daylight in.

STEP 5 Roof
Building core extends to the roof allowing maintanance room, also creating a rooftop bar.

Wall Section Details

➤ **Exterior Facade**

The façade honors Seattle's architectural heritage with textured red brick, anchored by a modern base of 4-inch thick Kalwall panels. This innovative, R-9 rated material diffuses daylight uniquely and transforms the building into a luminous landmark at night.

▼ **Interior Retail Corridor**

This retail corridor showcases the Kalwall system's impact, filtering natural light to create a soft, diffused atmosphere. The translucent grid casts dynamic patterns on the polished floor, harmonizing modern illumination with the warmth of the interior brickwork.

“THE BUSSIN BLOCKS”

Connecting the City and Neighborhood through a loopwalk

The Bussin Blocks constitute a 19-acre brownfield redevelopment that seeks to become Post Falls’ first walkable downtown nucleus. The first step of any city is to lay out its streets. The surrounding streets move into the site and divide it up according to the surrounding urban grid scale.

Secondary pathways break up the city grid with pedestrian and bicycle access. We believe that to achieve porosity, we need to limit our block size. This interconnected site serves as a springboard to connect to other urban centers in the Spokane-Coeur D’Alene metropolitan area.

The urban connectivity established, Post Falls acquires a commercial and cultural nucleus. By giving the center of the city more units, we eliminate the need for units on the city periphery, and ease the stress on the city infrastructure.

The site includes the Post Falls centennial trail, which divides the site between urban and suburban streetscapes, according to the city districts. The result is a dense urban gradient, highly responsive to its surroundings.

Adaptive Reuse Urban Design | View from south-west corner (Mixed-use Residence)

Conceptual Idea to Form Generation

THE CITY NODE
At North Lincoln Street and East 4th Avenue, this signalized intersection captures drivers and city traffic. Waiting cars frame views toward the silo, creating curiosity. This node invites first-time visitors and acts as the primary urban gateway into the loop.

THE NEIGHBORS NODE
Located at North Lincoln Street and East Railroad Avenue, this node serves nearby residents. It is the most informal entry, supporting daily walking, casual use, and short visits from the surrounding neighborhood.

THE SILO NODE
This node anchors memory. The preserved mill silo marks the past and gives the loop its monument. People enter here to connect with the site's industrial history and begin the walk with a strong visual and emotional reference.

THE TRAIL NODE
This node connects directly to Centennial Trail. Cyclists and runners enter the loop here, shifting from fast movement to a slower, social promenade. It works as a transition between regional mobility and local experience.
